Electric vehicles will help spread equality

Ending fossil-fueled vehicles portends even more upheaval in our economy than the pandemic. However, the transition to renewable energy-powered transportation will lift all people. Electric vehicles represent a rebirth of transportation in the image of equality.

The fruits of transit equality will more than pay for the cost of economic upheaval because a system built on marginal costs approaching zero enables inclusion and maximizes efficiency. Everyone from those with disabilities, to the daily commuter and the business sector will benefit from the year-over-year declining cost of transit. Private- and publicly owned fleets built around public transportation will grow into a universal transit system that does not require a driver's license nor long waits.

Battery and automation innovation are making electric vehicles ready to roll while scrubbing carbon pollution down to a page in history. Electric vehicles and public transit are the keys to rekindling and building upon our common good where we all affordably share access to our heritage across a vast geography.

Locally, Citilink is leading the way to bring public transit back into electric vehicles in Fort Wayne and beyond. A united people will rise across the economy, cultures, ability, race and other signatures of a diverse and vibrant world. Public transportation is at the center providing the strength where EV stands for both electric and equality vehicle.
